COORDINATES OF A VECTOR

Assume that V is a vector space with $n = \dim V < \infty$.

Let

- ① $B = \{\mathbf{b}_1, \mathbf{b}_2, \dots, \mathbf{b}_n\}$ be a basis of V
- ② $E = \{\mathbf{e}_1, \mathbf{e}_2, \dots, \mathbf{e}_n\}$ be the standard basis for \mathbb{R}^n .

Given any $\mathbf{v} \in V$ with $\mathbf{v} = v_1\mathbf{v}_1 + v_2\mathbf{v}_2 + \dots + v_n\mathbf{v}_n$, define the linear transformation $C_B : V \rightarrow \mathbb{R}^n$ as

$$C_B(\mathbf{v}) = v_1\mathbf{e}_1 + v_2\mathbf{e}_2 + \dots + v_n\mathbf{e}_n = \begin{bmatrix} v_1 \\ v_2 \\ \vdots \\ v_n \end{bmatrix}.$$

DEFINITION 1. The linear transformation C_B is called the **coordinates isomorphism**.

Notes:

- ① The coordinates isomorphism C_B gives a way to regard any vector space V of dimension n as \mathbb{R}^n .
- ② In mathematical jargon, we say that V ($\dim V = n$) and \mathbb{R}^n are **isomorphic**.
- ③ More generally, two vector spaces V and W are isomorphic if there is a linear transformation $T : V \rightarrow W$ which is onto and one-to-one.

DEFINITION 2. Let V , W and U be vector spaces. Let $T : V \rightarrow W$ and $S : W \rightarrow U$ be linear transformations. The **composite transformation** $ST : V \rightarrow U$ of T and S is defined by

$$ST(\mathbf{v}) = S(T(\mathbf{v})) \quad \mathbf{v} \in V.$$

Notes:

- ① ST is a linear transformation.
- ② TS might not be defined unless $U = V$.
- ③ We say that $T : V \rightarrow W$ is an **isomorphism** if there exists a linear transformation $S : W \rightarrow V$ such that:
 - $ST = 1_V$.
 - $TS = 1_W$.

In this case, $S = T^{-1}$ is called the inverse of T .

EXAMPLE 1. Let $B = \{1, x, x^2\}$ be a basis for \mathbf{P}_2 .

- a) Find the coordinate transformation C_B .
- b) Find C_B^{-1} .

SOLUTION.
